## About this Review

For 59 years, the BP Statistical Review of World Energy has provided high-quality, objective and globally consistent data on world energy markets. The Review is one of the most widely respected and authoritative publications in the field of energy economics, used for reference by the media, academia, world governments and energy companies. A new edition is published every June.

### Guide to navigation

*BP Statistical Review of World Energy June 2010* uses the following icons and colour coding to help you navigate your way quickly and easily through the document. Icons and colours represent various energy types so you can see, at a glance, which section you are in.

### Oil

### Natural gas

### Coal

### Nuclear energy

### Hydroelectricity

### Primary energy

### Find out more online

*BP Statistical Review of World Energy June 2010* is available online at [www.bp.com/statisticalreview](http://www.bp.com/statisticalreview). The website contains all the tables and charts found in the latest printed edition, plus a number of extras, including:

- Historical data from 1965 for many sections.
- Additional data for natural gas, coal, hydroelectricity, nuclear energy, electricity and renewables.
- An energy charting tool, where you can view predetermined reports or chart specific data according to energy type, region and year.
- An oil, natural gas and LNG conversion calculator.
- PDF versions and PowerPoint slide packs of the charts, maps and graphs, plus an Excel workbook of the historical data.

### About BP

BP is one of the world's largest oil and gas companies, serving millions of customers in more than 90 countries across six continents. Our business segments are Exploration and Production, and Refining and Marketing. Through these business segments, we provide fuel for transportation, retail brands and energy for heat and light.

### Appendices

For approximate conversion factors and definitions see page 44.

[bp.com/statisticalreview](http://bp.com/statisticalreview)

The data series for proved oil and gas reserves in *BP Statistical Review of World Energy June 2010* does not necessarily meet the definitions, guidelines and practices used for determining proved reserves at company level, for instance, under UK accounting rules contained in the Statement of Recommended Practice, 'Accounting for Oil and Gas Exploration, Development, Production and Decommissioning Activities' (UK SORP) or as published by the US Securities and Exchange Commission, nor does it necessarily represent BP's view of proved reserves by country. Rather, the data series has been compiled using a combination of primary official sources and third-party data.

## Group chief executive's introduction

# Energy in 2009 – from recession to recovery

**Tony Hayward** Group Chief Executive  
June 2010

Welcome to the 2010 edition of the BP Statistical Review of World Energy.

Before addressing some of the themes that emerge from this Review, I would like to devote a few words to the tragic accident in April involving the Deepwater Horizon drilling rig and the subsequent release of oil into the Gulf of Mexico. As of this writing, BP is working closely with governments and private sector experts to stop the flow of oil and to minimize the damage to the environment. We are throwing everything we have at mitigating this disaster. Our thoughts are with those who have lost loved ones, and those whose livelihoods have been disrupted. We are determined to set right what has gone wrong and to learn from the tragedy. Eventually, we will succeed, and eventually, this disaster will lead to a safer and better energy world.

It is the world of energy that is described by the Statistical Review of World Energy. Energy developments in 2009 were dominated by a global recession and, later in the year, a tentative recovery. For the year as a whole, the global economy contracted for the first time since the Second World War, and global energy consumption fell as well. We can't know how durable this recovery will be. But the data shows changes in the pattern of global energy consumption that are likely to indicate long-term change.

Let me highlight a few insights from the data assembled in this Review. First, global primary energy consumption fell in 2009, but like the broader economic downturn, changes varied greatly across regions. In the OECD, energy consumption fell faster than GDP – the sharpest decline in energy consumption on record. The OECD consumed less primary energy last year than 10 years ago, although GDP since then has risen by 18%. The developing world outside the Former Soviet Union, in contrast, saw energy consumption growing faster than GDP. Globally, the energy intensity of economic activity rose last year, fostered by slower growth and by many energy-intensive fiscal stimulus programmes – but against the longer-term trend.

With consumption falling, energy prices declined in 2009, though again the pattern varied by fuel. Oil prices began the year below \$40 per barrel, and increased steadily during the year as OPEC production cuts were greater than the decline in consumption. Natural gas in competitive markets fell sharply and remained weak through most of the year due to falling consumption, continued development of unconventional resources in the US and rising LNG supply. And coal prices fell and then started to recover, while displaying regional variety.

The recession and now, hopefully, the recovery, has taught us how interlinked the world really is. Let me name just two of the data highlights of this year's Review that symbolize the challenges ahead for all of us. China became a large-scale coal importer, which prevented global coal consumption from falling; and, given the OPEC cuts, the world's largest increase in oil production by far came from the US, mainly from the Gulf of Mexico. This is not an excuse for anything, but a piece of the reality in which we all live.

Clarity of focus on objective data has been a hallmark of BP's Statistical Review – in good times and bad – for 59 years. As the world recovers from recession and turns its attention toward enduring matters of economic development, energy security and climate change, I hope you will find this Review to be a useful source of objective information and perspective.

I would like to thank BP's economics team and all those around the world who have been involved in preparing this Review – in particular our government contacts in many countries who report the official data.

## 2009 in review

Global economic recession drove energy consumption lower in 2009 – the first decline since 1982. As with the economic contraction, the decline in energy consumption was concentrated in OECD countries and the territory of the Former Soviet Union (FSU). Consumption of oil, natural gas and nuclear power declined, while coal consumption was essentially flat; only hydroelectric output and other renewable forms of energy increased in 2009. This data suggests global CO<sub>2</sub> emissions from energy use fell for the first time since 1998.

For the year as a whole, prices for all forms of traded energy fell, with the sharpest declines seen for traded natural gas and coal in North America and western Europe – although Asian coal prices fell less sharply in face of strong Chinese import growth. Oil prices declined for the first time since 2001. During 2009 prices for oil and coal in competitive markets hit their low points early in the year, with oil prices recovering first, while spot natural gas prices in North America and western Europe continued to decline well into 2009.

### Energy developments

World primary energy consumption – including oil, natural gas, coal, nuclear and hydro power – fell by 1.1% in 2009, the first decline since 1982 and the largest decline (in percentage terms) since 1980. Consumption in OECD countries fell by 5%, the largest decline on record; OECD consumption reached the lowest level since 1998. Energy consumption declined in all regions except Asia Pacific and the Middle East; Chinese energy consumption growth accelerated to 8.7%. Hydroelectric power generation increased by 1.5%, and was the world's fastest-growing major fuel for a second consecutive year.

### Global primary energy consumption

**-1.1%**

The largest decline since 1980

## Oil

Dated Brent averaged \$61.67 per barrel in 2009, a decline of 37% – the largest decline (in percentage terms) since 1986. Other benchmark crudes registered similar declines. Prices began the year below \$40 and rose steadily throughout the year, reaching a peak of more than \$78 in mid-November. Sustained OPEC production cuts and improving economic prospects as the year progressed supported prices.

Global oil consumption declined by 1.2 million barrels per day (b/d), or 1.7%, the largest decline since 1982. OECD consumption fell by 4.8% (2 million b/d), a fourth consecutive decline. Outside the OECD, consumption growth slowed to 860,000b/d, or 2.1%, the weakest percentage growth since 2001. China, India and Middle Eastern countries accounted for all of the non-OECD growth.

Global oil production dropped even more rapidly than consumption, falling by 2 million b/d, or 2.6%, the largest drop, again, since 1982. OPEC production cuts implemented late in 2008 were maintained throughout 2009, resulting in a decline of 2.5 million b/d, or 7.3%. Every OPEC member participating in the production-cutting agreement reduced output in 2009. OPEC's Middle Eastern members accounted for nearly 75% of the overall reductions.

Oil production outside OPEC grew by 0.9% or 450,000b/d. US production increased by 460,000b/d, or 7%, the largest increase in the world last year and largest US percentage increase in our data set. Elsewhere, production growth in Russia, Brazil, Kazakhstan and Azerbaijan was offset by declines in China and mature OECD provinces of Mexico, Norway and the UK. Overall OECD production declined for a seventh consecutive year.

Global refining capacity in 2009 grew by 2.2%, or 2 million b/d, the largest increase since 1999. Non-OECD capacity surpassed OECD capacity for the first time. The Asia-Pacific region accounted for more than 80% of the global growth, largely due to increases in India

(+19.5%, or 580,000b/d) and China (+10.5%, or 820,000b/d). Global crude runs fell along with oil consumption, declining by 1.5 million b/d, or 2%. Throughput declines were concentrated in the EU (-6.4%, or 870,000b/d) and other OECD countries; throughput outside the OECD increased by 0.9% or 310,000b/d, as strong growth in China and other Asia-Pacific countries more than offset declining throughput in South and Central America (-11.4%, or 610,000b/d). Higher refining capacity and declining consumption pushed global refinery utilization to 81.1%, the lowest rate since 1994.

Global oil trade fell by 3.1% or 1.7 million b/d, a second consecutive decline and the largest decline since 1987. The US accounted for 84% of the net decline in imports, driven by declining consumption and rising domestic production. Among exporters, the Middle East – with falling production and rising domestic consumption – accounted for virtually the entire decline.

### OPEC oil production

**-7.3%**

The largest decline since 1983

## Natural gas

Globally, natural gas was the fuel that experienced the most rapid decline in consumption, falling by 2.1%, the largest decline on record. Consumption declined in all regions except the Middle East and Asia Pacific. Russia had the world's largest decline (in volumetric terms), with consumption falling by 6.1%. OECD consumption fell by 3.1%, the largest decline since 1982; the decline in the US was a relatively modest 1.5%, as weak prices improved gas's competitive standing against other fuels. Iran saw the world's largest volumetric consumption growth, while Indian consumption growth of 25.9% was the highest among major countries in percentage terms.

Global gas production declined for the first time on record. Production fell sharply in Russia (-12.1%) and Turkmenistan (-44.8%), driven by declining consumption – in Russia and much of the rest of Europe – and the availability in Europe of competitively priced liquefied natural gas (LNG). Continued expansion of unconventional supplies allowed the US to record the world's largest increase in production for the third consecutive year, surpassing Russia as the world's largest producer. Production in the Middle East and Asia Pacific also increased, driven by growth in Iran, Qatar, India and China.

Global natural gas trade (excluding intra-FSU trade) contracted by 2.1% in 2009; pipeline shipments contracted by 5.8%, more than offsetting a 7.6% increase in LNG trade. The continued ramp-up of Qatari exports and the emergence of Russia as an exporter drove LNG growth, which accounted for 30.5% of gas trade (excluding intra-FSU). The decline in pipeline shipments was driven by lower shipments from Russia to Europe and from Canada to the US. This year's data for the first time includes intra-FSU trade, which stood at 80.4 billion cubic metres in 2009 – 9.2% of global gas trade.

### Natural gas production

**-2.1%**

The first decline on record

## Coal's share of world energy consumption

# 29.4%

The highest since 1970

## Other fuels

Global coal consumption was flat in 2009, the weakest annual change since 1999. The OECD (-10.4%) and the FSU (-13.3%) experienced the steepest consumption declines on record, due to the combination of recession and competitively priced natural gas. Elsewhere, consumption grew by 7.4%, near the historical average, with China accounting for 95% of the increase. Consumption fell in all regions except Asia-Pacific and the Middle East.

Global nuclear output dropped by 1.3%, a third consecutive global decline. Asia-Pacific growth, led by a recovery of Japanese output from earlier earthquake-related outages, did not offset declines elsewhere. Hydroelectric generation grew by a below-average 1.5%, which was nonetheless sufficient to make hydro the world's fastest-growing major fuel in 2009. Growth was led by China, Brazil and the US.

While other forms of renewable energy remain a small share of the global energy mix, they have continued to grow rapidly. Continued government support, including targeted fiscal stimulus in many countries, helped to boost global wind and solar generation capacity by 31% and 47% respectively. Wind growth was led by China and the US, which accounted for a combined 62.4% of total growth. Ethanol production rose by 8.1% – just over half the historical average; continued robust growth in the US (which accounts for 52.9% of global ethanol supply) was partly offset by a decline in Brazil (33.9% of global output). Additional detail on renewable forms of energy, as well as electricity generation, is available at [www.bp.com/statisticalreview](http://www.bp.com/statisticalreview).

### Acknowledgements

We would like to express our sincere gratitude to the many contacts worldwide who provide the publicly-available data for this publication, and to the researchers at the Heriot-Watt University Energy Academy who assist in the data compilation.

\*More than 100 years.

†Less than 0.05.

♦Less than 0.05%.

‡Excludes Former Soviet Union.

•Remaining established reserves', less reserves 'under active development'.

**Notes:** Proved reserves of oil – Generally taken to be those quantities that geological and engineering information indicates with reasonable certainty can be recovered in the future from known reservoirs under existing economic and operating conditions. Reserves-to-production (R/P) ratio – If the reserves remaining at the end of any year are divided by the production in that year, the result is the length of time that those remaining reserves would last if production were to continue at that rate. Source of data – The estimates in this table have been compiled using a combination of primary official sources, third-party data from the OPEC Secretariat, *World Oil, Oil & Gas Journal* and an independent estimate of Russian reserves based on information in the public domain. Canadian proved reserves include an official estimate of 27.1 billion barrels for oil sands 'under active development'. Venezuelan reserves are taken from the *OPEC Annual Statistical Bulletin*, which notes that the figure includes "proven reserves of the Magna Reserve Project in the Orinoco Belt, which amounted to 94,168mb in 2008". Reserves include gas condensate and natural gas liquids (NGLs) as well as crude oil.

Annual changes and shares of total are calculated using thousand million barrels figures.

\*Includes crude oil, shale oil, oil sands and NGLs (the liquid content of natural gas where this is recovered separately). Excludes liquid fuels from other sources such as biomass and coal derivatives.

♦Less than 0.05%.

‡Excludes Former Soviet Union.

**Notes: Annual changes and shares of total are calculated using million tonnes per annum figures.**

**Growth rates are adjusted for leap years.**

\*Includes crude oil, shale oil, oil sands and NGLs (the liquid content of natural gas where this is recovered separately). Excludes liquid fuels from other sources such as biomass and coal derivatives.

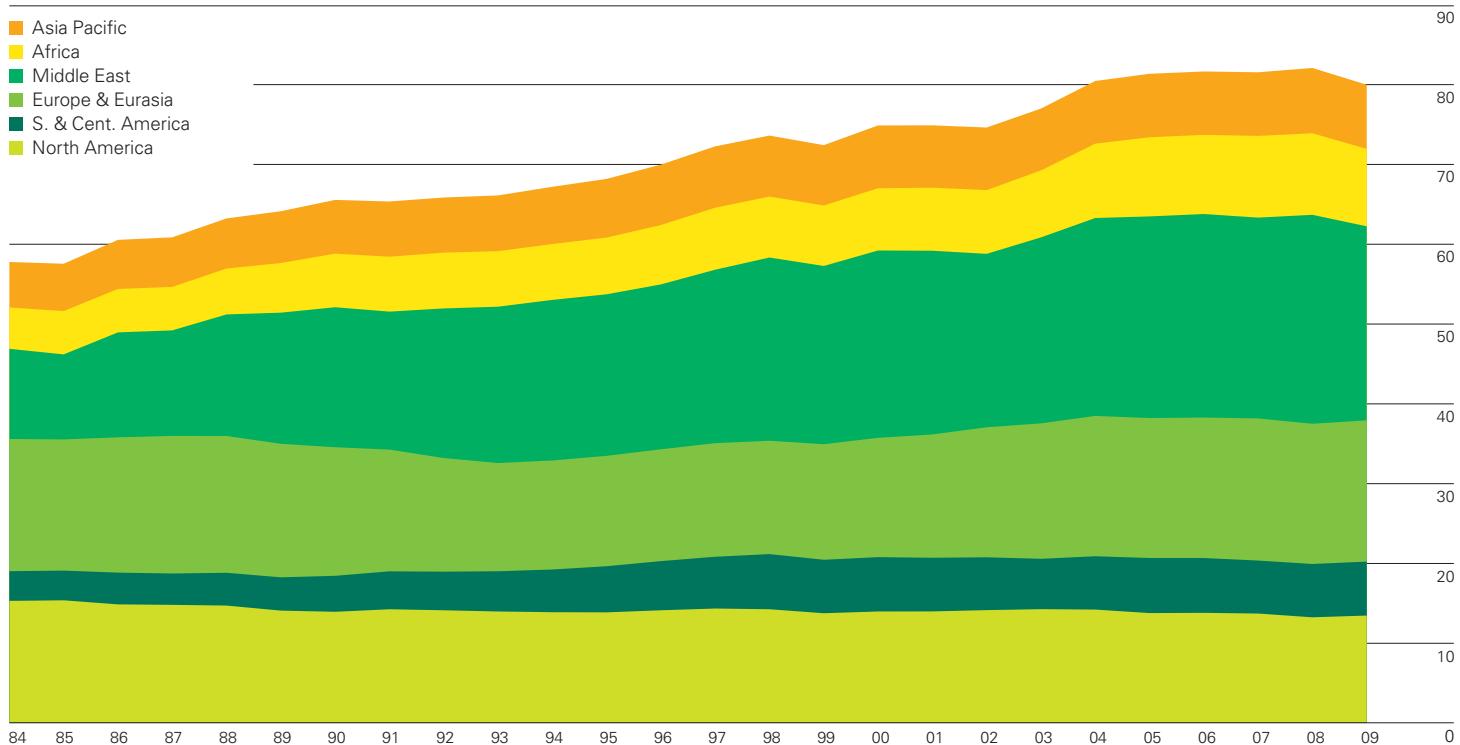

♦Less than 0.05%.

‡Excludes Former Soviet Union.

Note: Growth rates are adjusted for leap years.

## Production by region

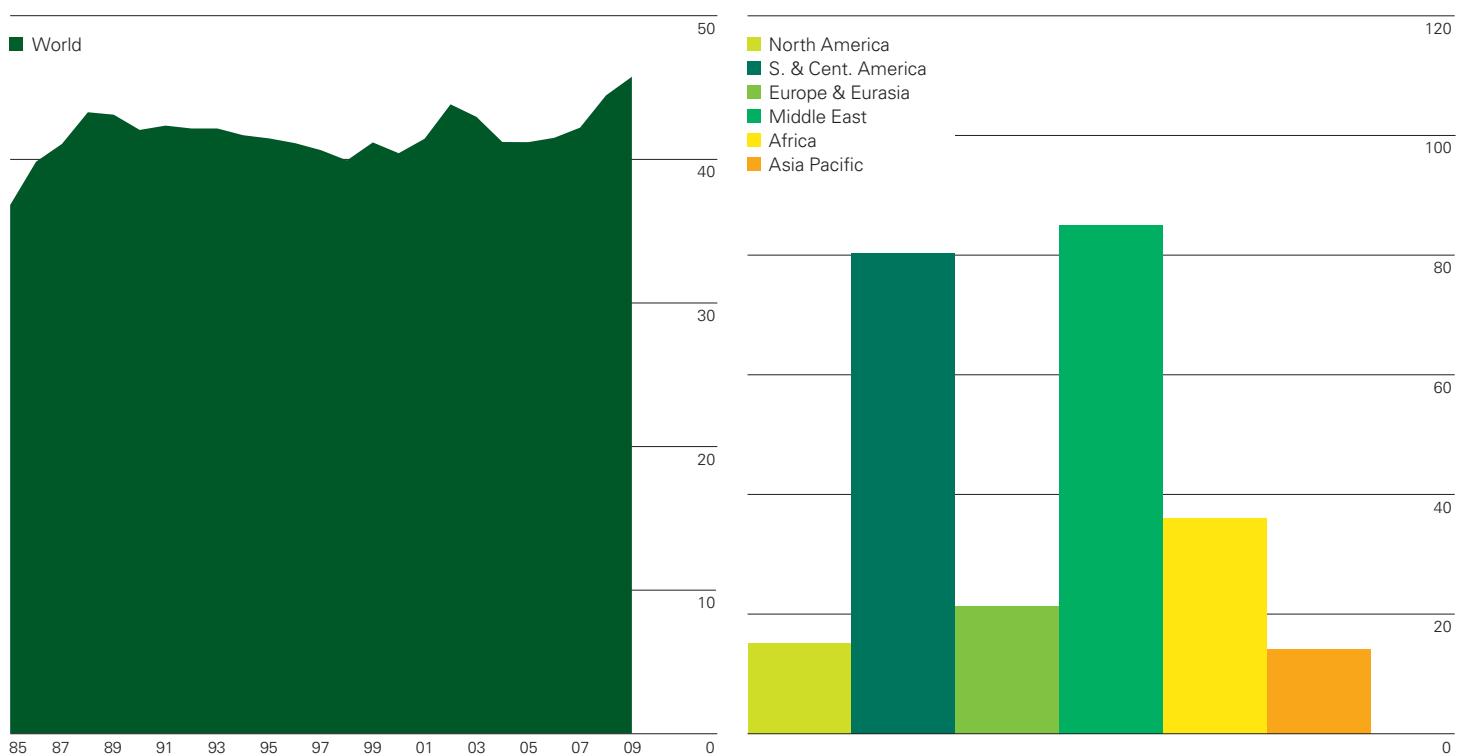

Million barrels daily

World oil production fell by 2 million b/d in 2009, the largest decline since 1982. OPEC production fell by 2.5 million b/d; Saudi Arabian output fell by 1.1 million b/d, the world's largest volumetric decline. Production outside OPEC rose by 450,000b/d, led by an increase of 460,000b/d in the US, the largest increase in the world and the strongest US growth since 1970.

## Reserves-to-production (R/P) ratios

Years

Global proved oil reserves rose by 0.7 billion barrels to 1,333.1 billion barrels, with an R/P ratio of 45.7 years. Increases in Indonesia and Saudi Arabia more than offset declines in Norway, Mexico and Vietnam. The 2008 figure has been revised higher by 74.4 billion barrels, largely due to an increase in Venezuelan official reserves.

\*Inland demand plus international aviation and marine bunkers and refinery fuel and loss. Consumption of fuel ethanol and biodiesel is also included.

•Less than 0.05%.

**Notes: Annual changes and shares of total are calculated using million tonnes per annum figures.**

**Growth rates are adjusted for leap years.**

Differences between these world consumption figures and world production statistics on page 8 are accounted for by stock changes, consumption of non-petroleum additives and substitute fuels, and unavoidable disparities in the definition, measurement or conversion of oil supply and demand data.

## Consumption by region

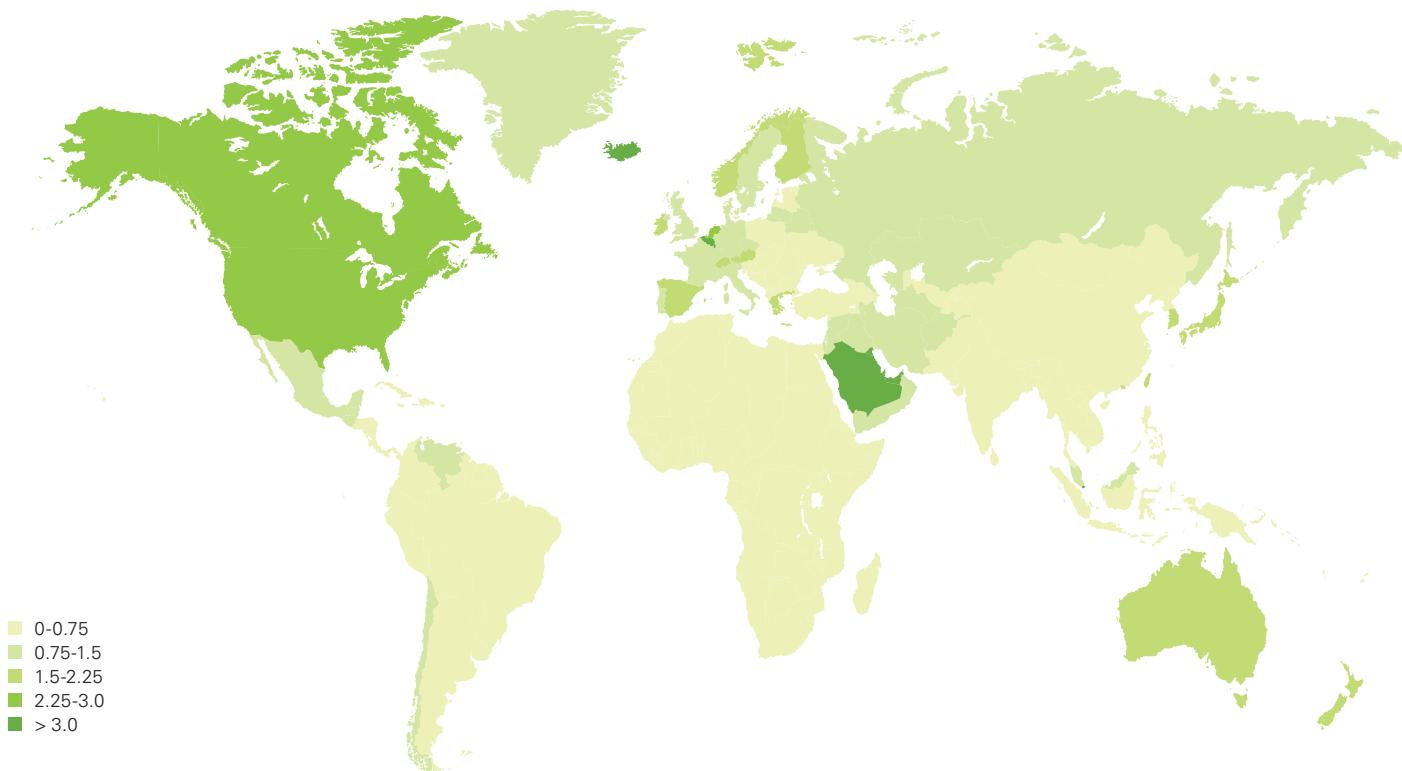

Million barrels daily

World oil consumption fell by 1.2 million b/d, a second consecutive decline and, like oil production, the largest decline since 1982. OECD consumption fell by 2 million b/d, a fourth consecutive annual decline. Consumption outside the OECD increased by 860,000b/d. Consumption declined in North America, South and Central America and Europe and Eurasia, outweighing modest increases in the Middle East, Africa and Asia-Pacific regions.

## Consumption per capita 2009

## Product consumption by region

Million barrels daily

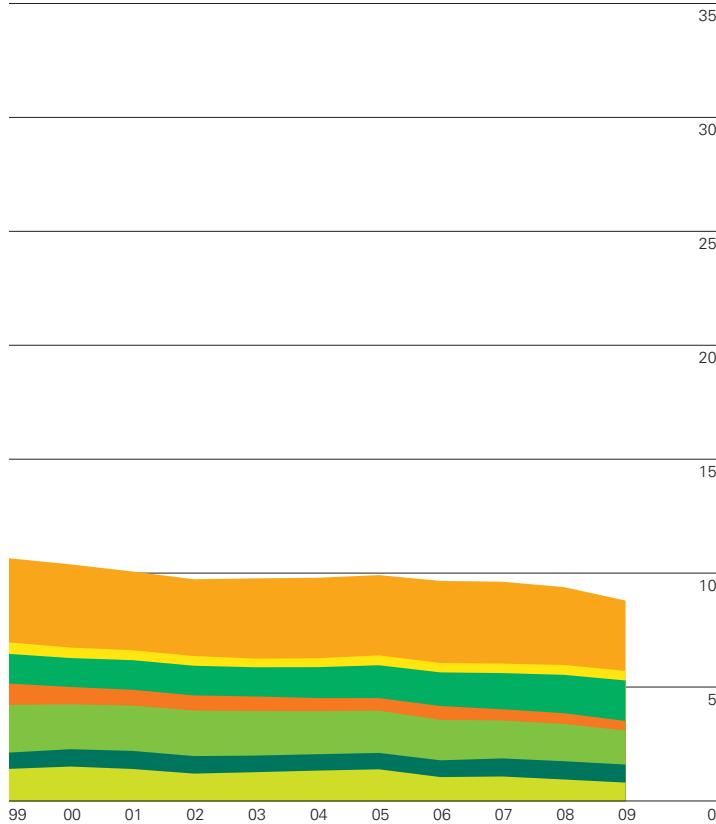

### Light distillates

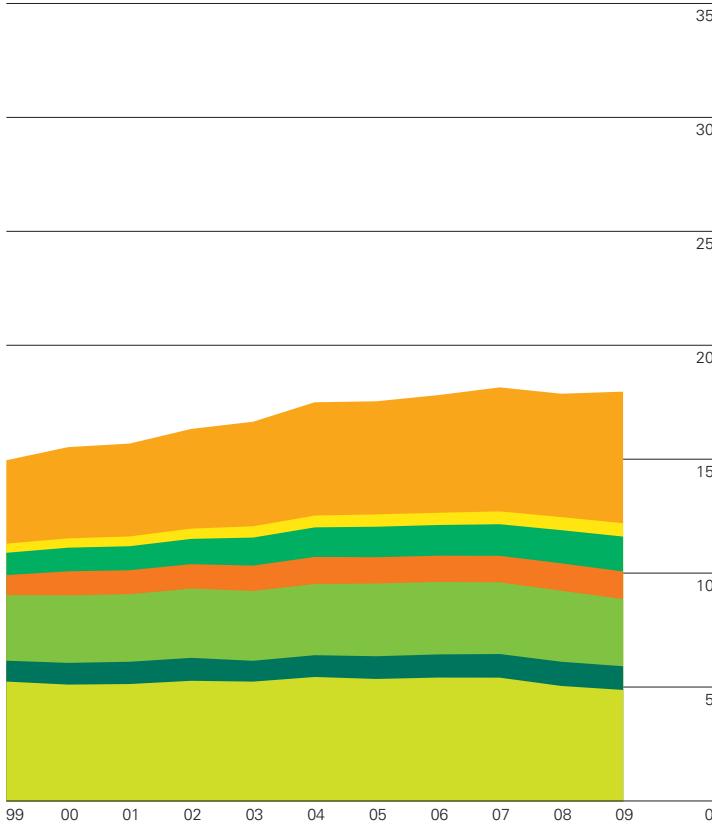

### Middle distillates

### Fuel oil

### Others

Consumption growth was below the 10-year average for all refined product groups. Middle distillates consumption declined for the first time since 1982, falling in all regions but the Middle East and Africa. Fuel oil consumption experienced the largest decline since 1985.

## Refinery utilization

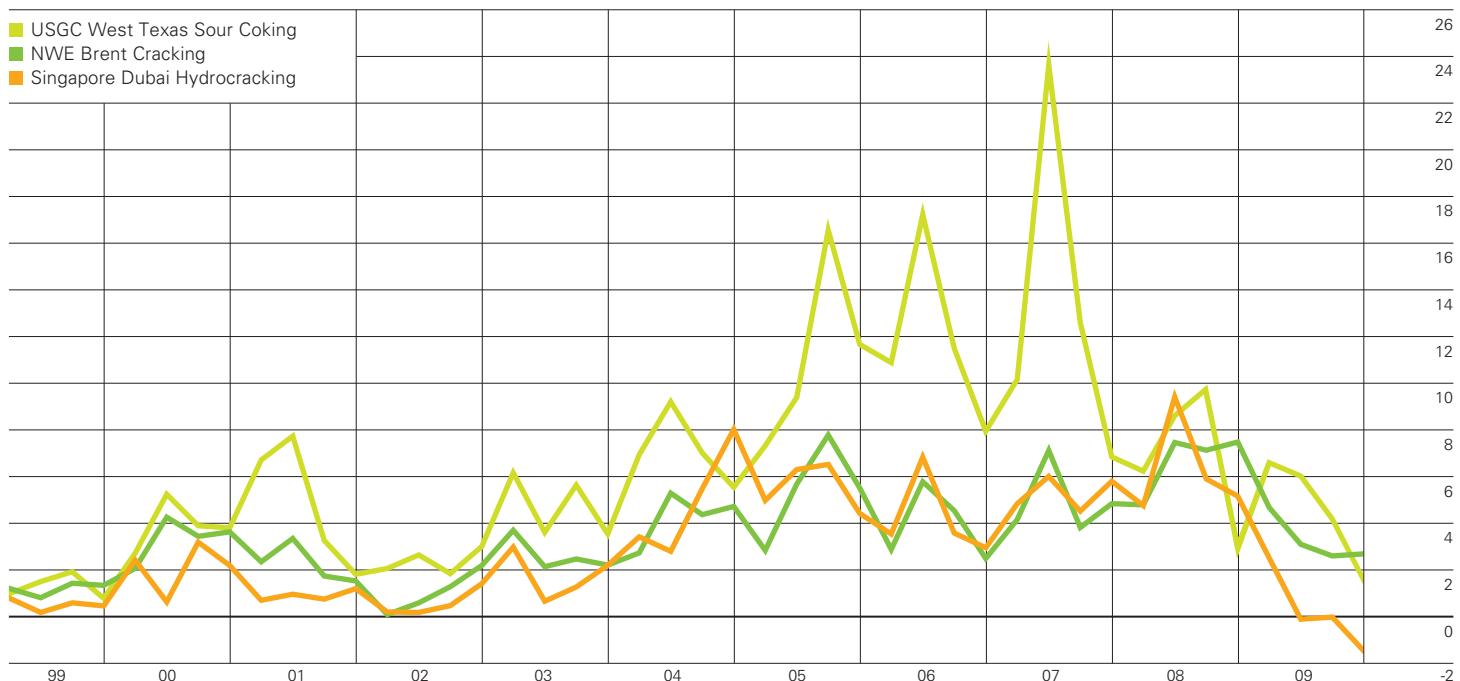

Percentage

Global crude runs fell by 1.5 million b/d in 2009 but continued to grow in China and India, where several new refining facilities commissioned. Most of the 2 million b/d increase in global refining capacity last year was also in China and India, allowing installed capacity in the non-OECD to overtake that of the OECD for the first time. Global average refinery utilization fell to 81.1%, the lowest level since 1994.

## Regional refining margins

US dollars per barrel

**Note:** The refining margins presented are benchmark margins for three major global refining centres: US Gulf Coast (USGC), North West Europe (NWE – Rotterdam) and Singapore. In each case, they are based on a single crude oil appropriate for that region and have optimized product yields based on a generic refinery configuration (cracking, hydrocracking or coking), again appropriate for that region. The margins are on a semi-variable basis, i.e. the margin after all variable costs and fixed energy costs.

**Notes:** Proved reserves of natural gas – Generally taken to be those quantities that geological and engineering information indicates with reasonable certainty can be recovered in the future from known reservoirs under existing economic and operating conditions. Reserves-to-production (R/P) ratio – If the reserves remaining at the end of any year are divided by the production in that year, the result is the length of time that those remaining reserves would last if production were to continue at that rate. Source of data – The estimates in this table have been compiled using a combination of primary official sources and third-party data from Ceditgaz and the OPEC Secretariat.

\*Excluding gas flared or recycled.

**Notes:** As far as possible, the data above represents standard cubic metres, measured at 15°C and 1013 millibar (mbar); because it is derived directly from tonnes of oil equivalent using an average conversion factor, it does not necessarily equate with gas volumes expressed in specific national terms.

Source: Includes data from Ceditaz.

**Annual changes and shares of total are calculated using million tonnes of oil equivalent figures.**

**Growth rates are adjusted for leap years.**

Natural gas production data expressed in billion cubic feet per day is available at [www.bp.com/statisticalreview](http://www.bp.com/statisticalreview).

## Production by region

Billion cubic metres

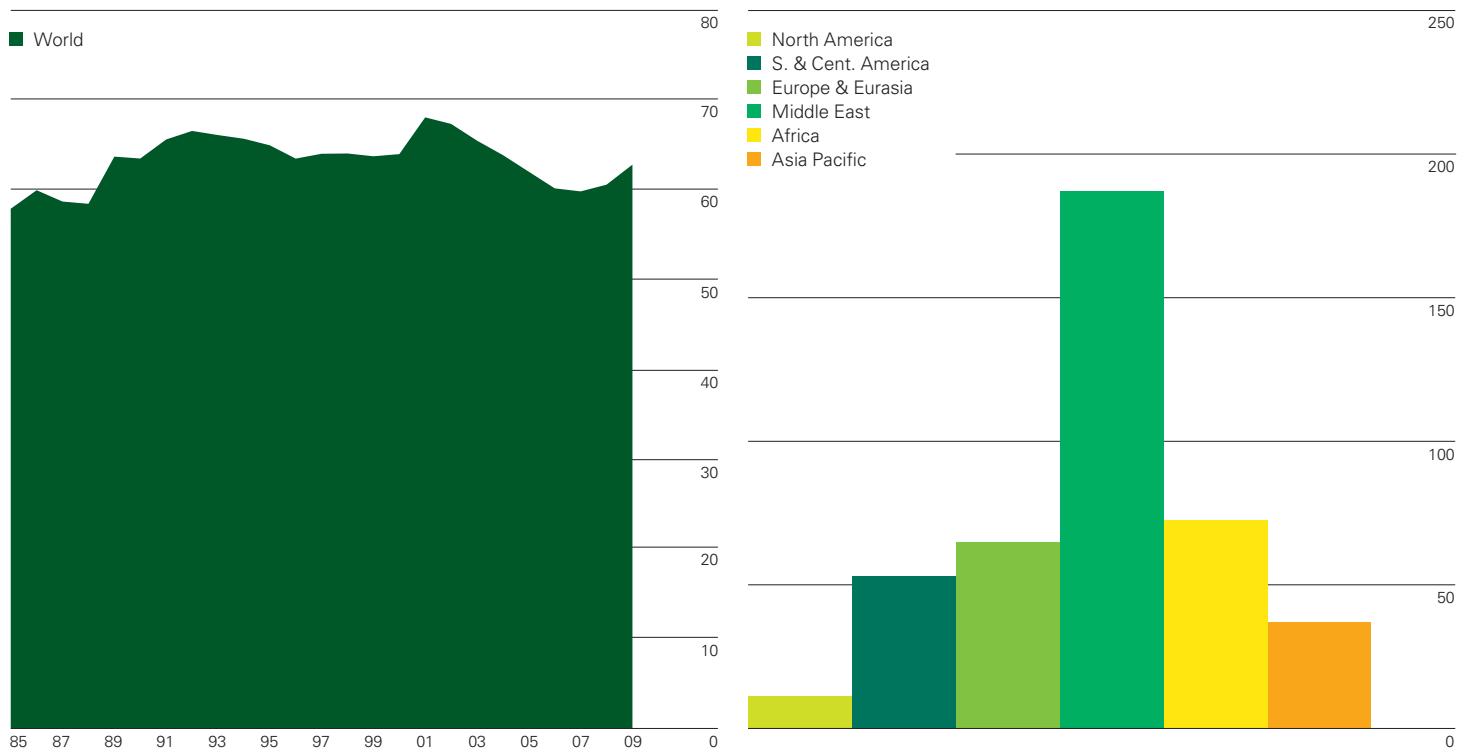

Global natural gas production fell by 2.1% in 2009, the first decline on record. Production fell sharply in Russia (-74.2bcm) and Turkmenistan (-29.7bcm), in each case the largest decline on record. The US recorded the largest increase in the world for the third consecutive year.

## Reserves-to-production (R/P) ratios

Years

2009 by region

World proved reserves of natural gas grew by 2.21 trillion cubic metres in 2009, driven by increases in Russia, Venezuela and Saudi Arabia. The global R/P ratio increased to 62.8 years.

## Consumption by region

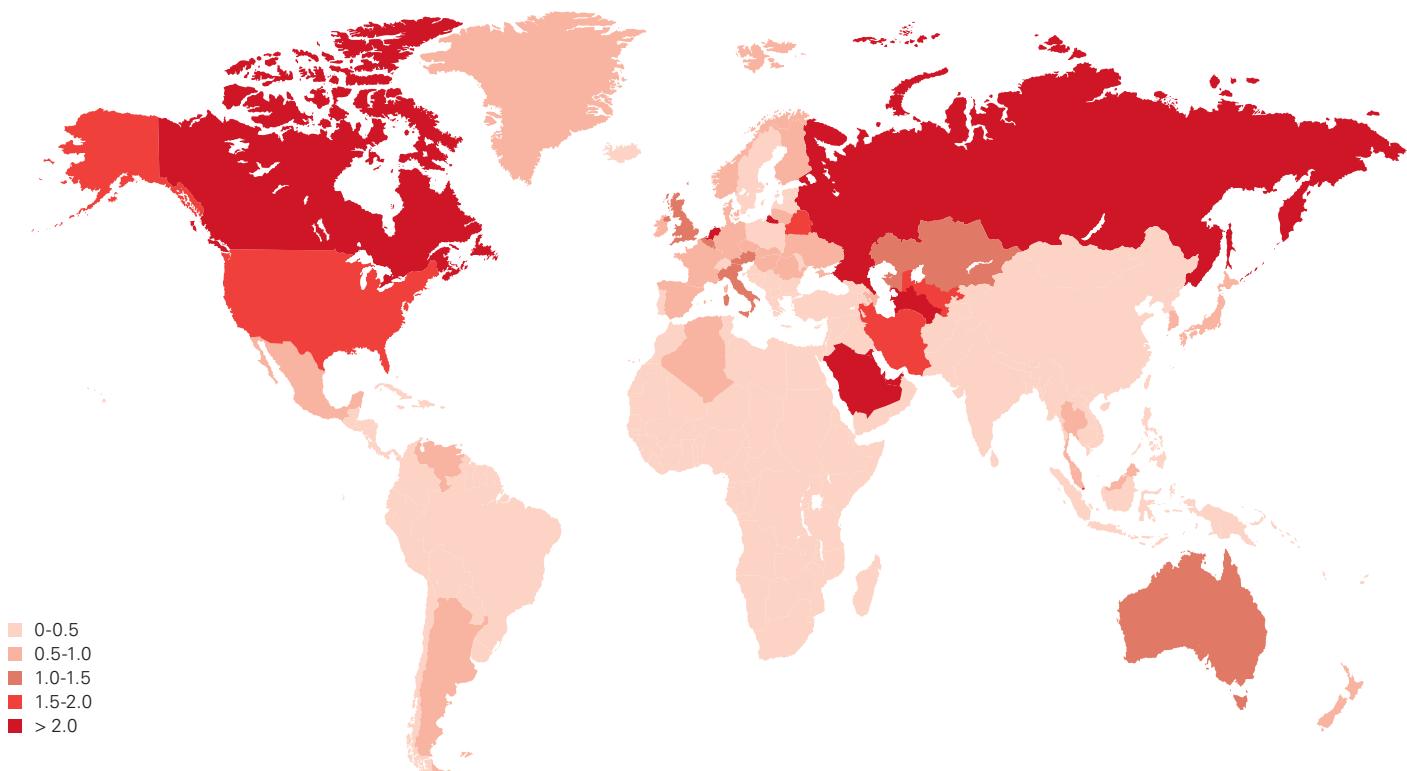

Billion cubic metres

World natural gas consumption fell by 2.1%, the most rapid decline on record and the sharpest decline among major fuels. Russia experienced the world's largest decline, with consumption falling by 26.3bcm. Consumption growth was below average in every region.

## Consumption per capita 2009

Tonnes oil equivalent

---

## Natural gas: trade movements 2009

Numbers in blue refer to liquefied natural gas (LNG) trade  
Numbers in black refer to pipeline trade

**Notes:** Proved reserves of coal – Generally taken to be those quantities that geological and engineering information indicates with reasonable certainty can be recovered in the future from known deposits under existing economic and operating conditions. Reserves-to-production (R/P) ratio – If the reserves remaining at the end of the year are divided by the production in that year, the result is the length of time that those remaining reserves would last if production were to continue at that rate.

Source of reserves data: World Energy Council, 2009.

### Production

Million tonnes oil equivalent

### Consumption

Million tonnes oil equivalent

World coal consumption was essentially flat in 2009, the weakest year since 1999. For the first time since 2002 coal was not the fastest-growing fuel in the world. The OECD and Former Soviet Union experienced the steepest declines on record, while growth elsewhere was near average, largely due to above-average growth in China, which accounted for 46.9% of global coal consumption.

\*Based on gross generation and not accounting for cross-border electricity supply. Converted on the basis of thermal equivalence assuming 38% conversion efficiency in a modern thermal power station.

†Less than 0.05.

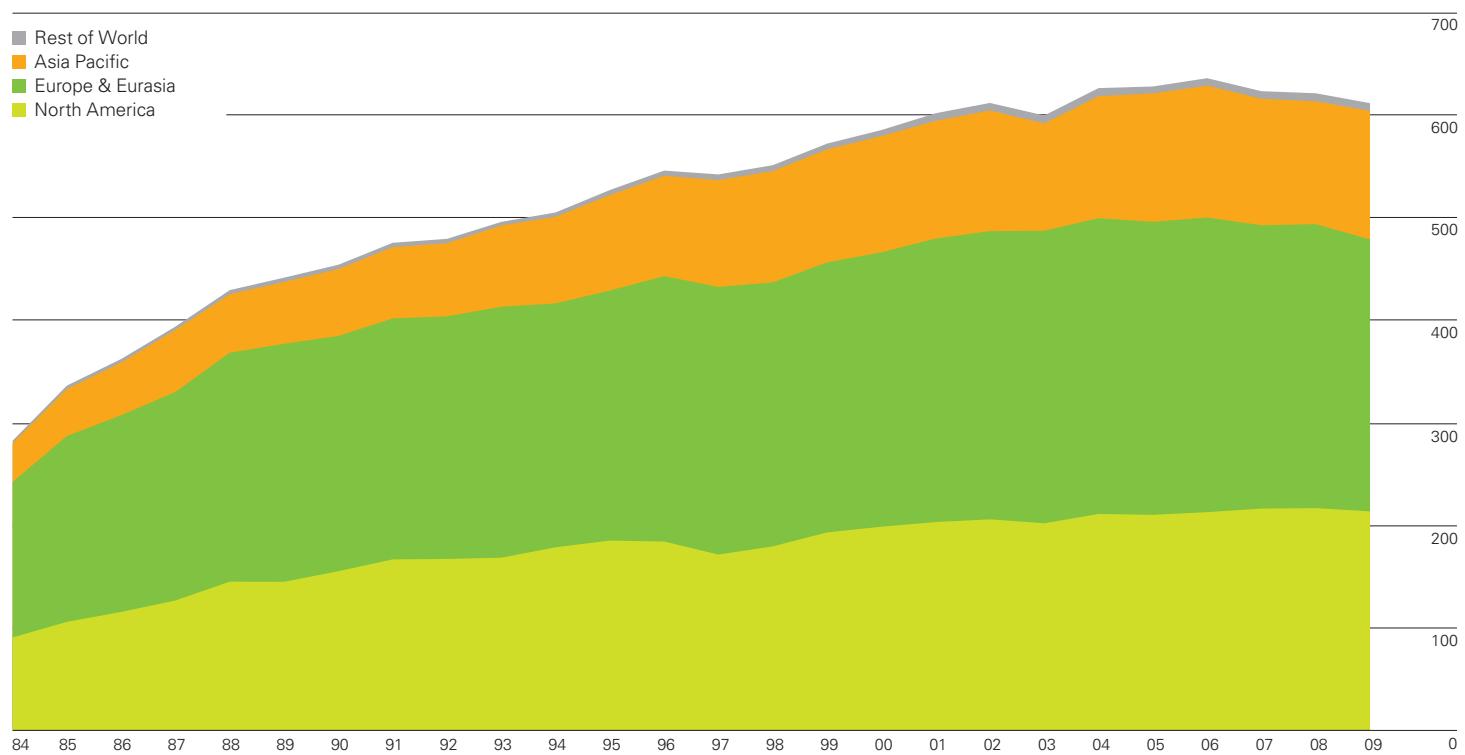

**Notes: Growth rates are adjusted for leap years.**

Nuclear energy data expressed in terawatt-hours is available at [www.bp.com/statisticalreview](http://www.bp.com/statisticalreview).

## Consumption by region

Million tonnes oil equivalent

- Rest of World
- Asia Pacific
- Europe & Eurasia
- North America

Global nuclear power generation declined by 1.3%, a third consecutive annual decline. Lower output in Europe and Eurasia, as well as North America, outweighed increases in Asia Pacific.

## Consumption by region

Million tonnes oil equivalent

Hydroelectric output grew by a below-average 1.5%, which was nonetheless sufficient to make it the world's most rapidly-growing major fuel in 2009. Growth was led by China, Brazil and the US.

\*In this Review, primary energy comprises commercially traded fuels only. Excluded, therefore, are fuels such as wood, peat and animal waste that, although important in many countries, are unreliably documented in terms of consumption statistics. Also excluded are wind, geothermal and solar power generation.

†Less than 0.05.

Note: Oil consumption is measured in million tonnes; other fuels in million tonnes of oil equivalent.

## World consumption

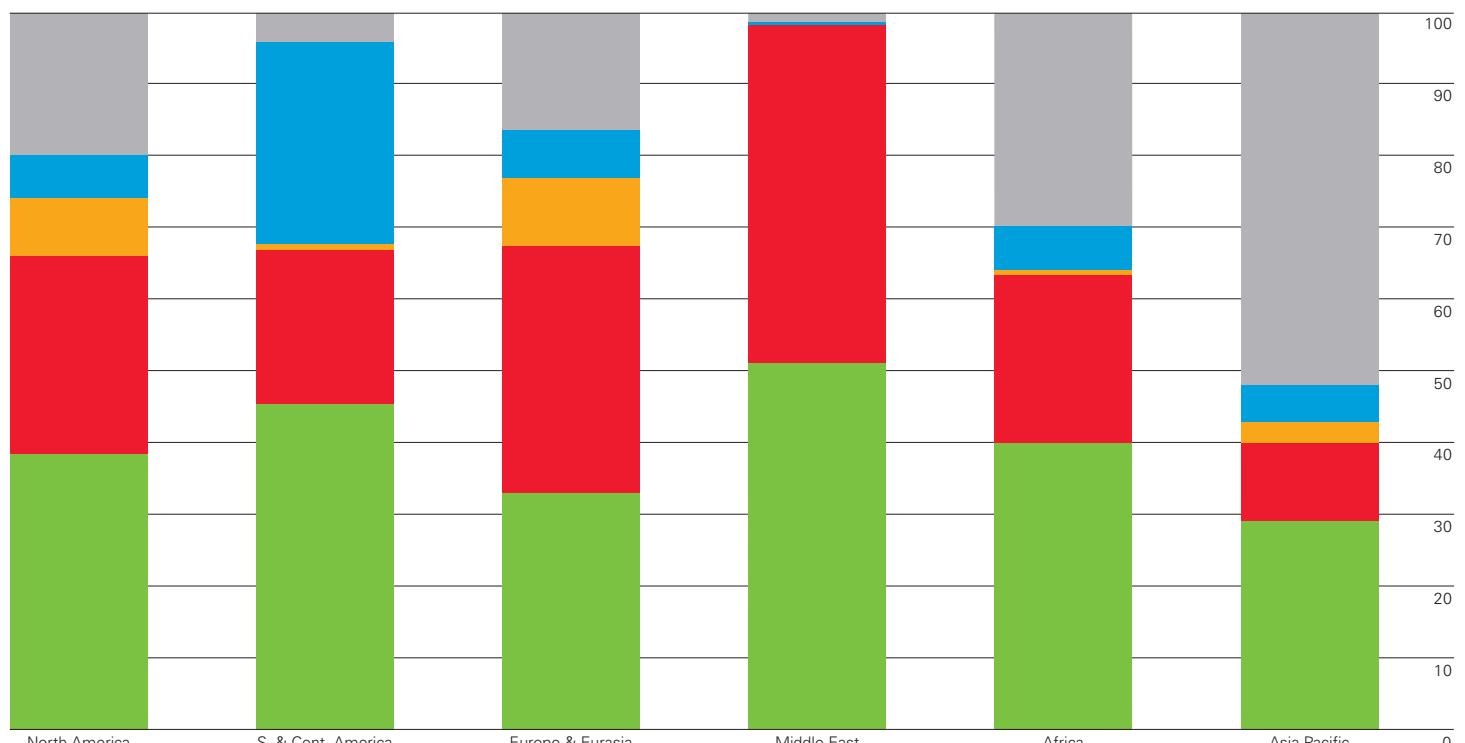

Million tonnes oil equivalent

World primary energy consumption fell by 1.1% in 2009, the first decline since 1982. Consumption was weaker than average in all regions. While oil remains the leading fuel (accounting for 34.8% of global primary energy consumption), it continues to lose market share. Coal's share of global energy consumption was the highest since 1970.

## Regional consumption pattern 2009

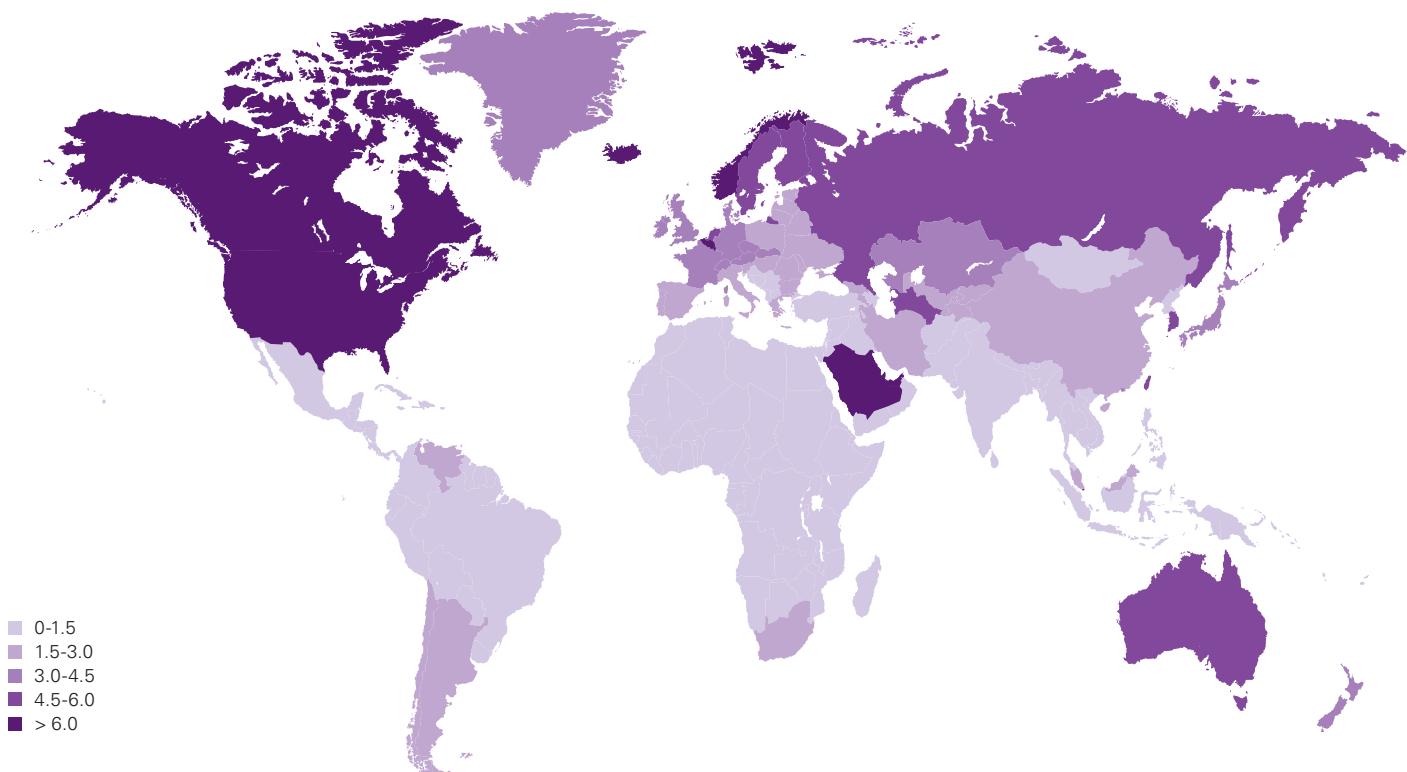

Percentage

Oil remains the world's dominant fuel, although it has lost market share over the past decade – globally and in every region. Natural gas has the leading market share in Europe and Eurasia, while coal is the dominant fuel in Asia Pacific. Regionally, oil and natural gas have the highest market shares in the Middle East; coal in Asia Pacific; and nuclear and hydro in Europe and Eurasia.

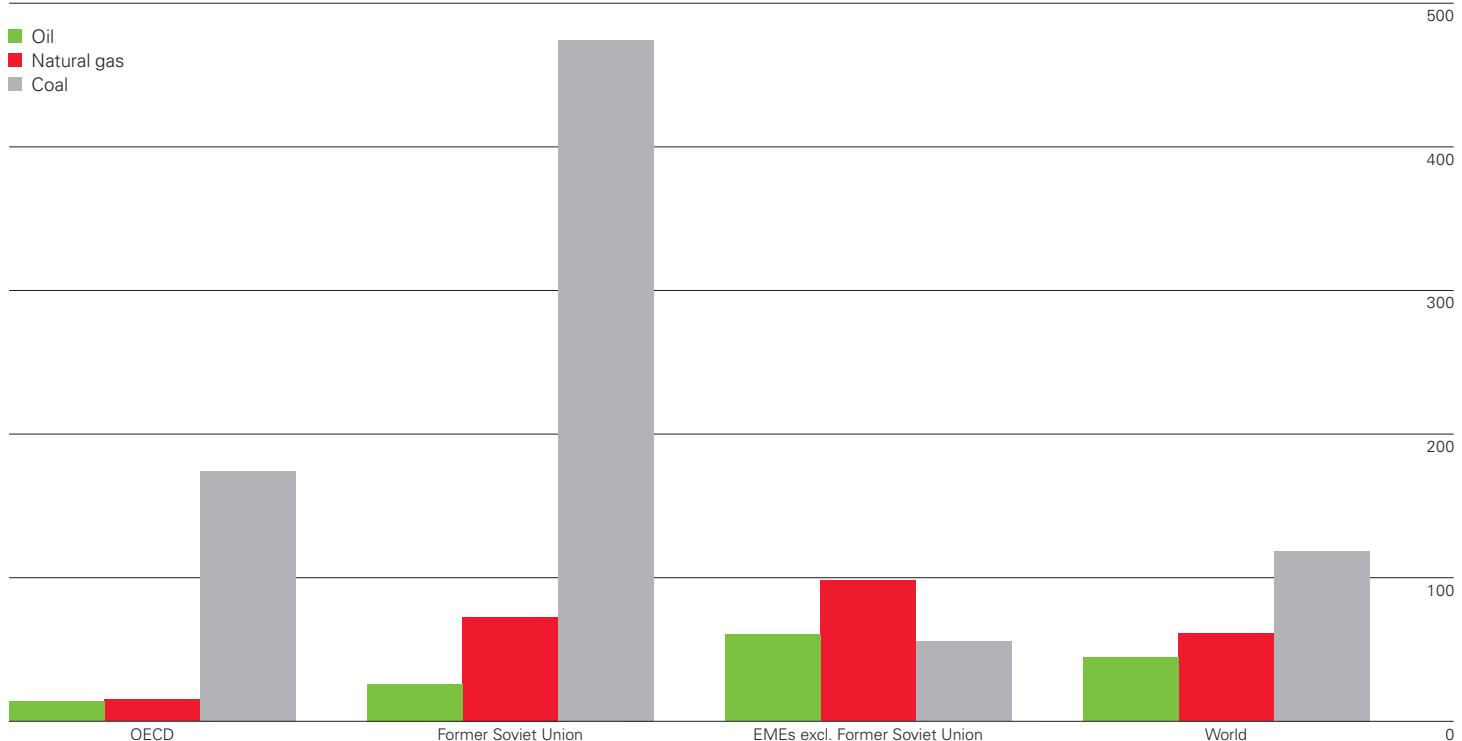

## Consumption per capita 2009

Tonnes oil equivalent

## Fossil fuel reserves-to-production (R/P) ratios at end 2009

Years

While coal remains the world's most abundant fossil fuel, with an R/P ratio of 119 years, proved reserves of oil and natural gas increased in 2009 and have tended to rise over time. OECD countries account for less than 10% of global proved reserves for oil and natural gas, but 42.6% of proved coal reserves.

# Appendices

## Approximate conversion factors

## Definitions

Statistics published in this Review are taken from government sources and published data. No use is made of confidential information obtained by BP in the course of its business.

Country groupings are made purely for statistical purposes and are not intended to imply any judgement about political or economic standings.

### North America

US (excluding Puerto Rico), Canada, Mexico.

### South and Central America

Caribbean (including Puerto Rico), Central and South America.

### Europe

European members of the OECD plus Albania, Bosnia-Herzegovina, Bulgaria, Croatia, Cyprus, Former Yugoslav Republic of Macedonia, Gibraltar, Malta, Romania, Serbia and Montenegro, Slovenia.

### Former Soviet Union

Armenia, Azerbaijan, Belarus, Estonia, Georgia, Kazakhstan, Kyrgyzstan, Latvia, Lithuania, Moldova, Russian Federation, Tajikistan, Turkmenistan, Ukraine, Uzbekistan.

### Europe and Eurasia

All countries listed above under the headings Europe and Former Soviet Union.

### Middle East

Arabian Peninsula, Iran, Iraq, Israel, Jordan, Lebanon, Syria.

### North Africa

Territories on the north coast of Africa from Egypt to western Sahara.

### West Africa

Territories on the west coast of Africa from Mauritania to Angola, including Cape Verde, Chad.

### East and Southern Africa

Territories on the east coast of Africa from Sudan to Republic of South Africa. Also Botswana, Madagascar, Malawi, Namibia, Uganda, Zambia, Zimbabwe.

### Asia Pacific

Brunei, Cambodia, China, China Hong Kong SAR\*, Indonesia, Japan, Laos, Malaysia, Mongolia, North Korea, Philippines, Singapore, South Asia (Afghanistan, Bangladesh, India, Myanmar, Nepal, Pakistan, Sri Lanka), South Korea, Taiwan, Thailand, Vietnam, Australia, New Zealand, Papua New Guinea, Oceania.

\*Special Administrative Region.

### Australasia

Australia, New Zealand.

### OECD members

**Europe:** Austria, Belgium, Czech Republic, Denmark, Finland, France, Germany, Greece, Hungary, Iceland, Republic of Ireland, Italy, Luxembourg, Netherlands, Norway, Poland, Portugal, Slovakia, Spain, Sweden, Switzerland, Turkey, UK.

**Other member countries:** Australia, Canada, Japan, Mexico, New Zealand, South Korea, US.

### OPEC members

**Middle East:** Iran, Iraq, Kuwait, Qatar, Saudi Arabia, United Arab Emirates.

## Units

1 metric tonne = 2204.62lb

= 1.1023 short tons

1 kilolitre = 6.2898 barrels = 1 cubic metre

1 kilocalorie (kcal) = 4.187kJ = 3.968Btu

1 kilojoule (kJ) = 0.239kcal = 0.948Btu

1 British thermal unit (Btu) = 0.252kcal

= 1.055kJ

1 kilowatt-hour (kWh) = 860kcal

= 3600kJ = 3412Btu

## Calorific equivalents

One tonne of oil equivalent equals approximately:

**Heat units** 10 million kilocalories  
42 gigajoules  
40 million British thermal units

**Solid fuels** 1.5 tonnes of hard coal  
3 tonnes of lignite

**Gaseous fuels** See Natural gas and liquefied natural gas table

**Electricity** 12 megawatt-hours

One million tonnes of oil or oil equivalent produces about 4400 gigawatt-hours (= 4.4 terawatt-hours) of electricity in a modern power station.

**North Africa:** Algeria, Libya.

**West Africa:** Angola, Nigeria.

**South America:** Ecuador, Venezuela.

### European Union members

Austria, Belgium, Bulgaria, Cyprus, Czech Republic, Denmark, Estonia, Finland, France, Germany, Greece, Hungary, Republic of Ireland, Italy, Latvia, Lithuania, Luxembourg, Malta, Netherlands, Poland, Portugal, Romania, Slovakia, Slovenia, Spain, Sweden, UK.

### Other EMEs (Emerging Market Economies)

South and Central America, Africa, Middle East, non-OECD Asia, non-OECD Europe.

## Methodology

The primary energy values of both nuclear and hydroelectric power generation have been derived by calculating the equivalent amount of fossil fuel required to generate the same volume of electricity in a thermal power station, assuming a conversion efficiency of 38% (the average for OECD thermal power generation).

## Percentages

Calculated before rounding of actuals. All annual changes and shares of totals are on a weight basis except on pages 6, 14, 18, 20 and 22.

## Rounding differences

Because of rounding, some totals may not agree exactly with the sum of their component parts.

## Tonnes

Metric equivalent of tons.
